Iron Lock Imports

A brief introduction to

THE AUSTRIAN COLLECTION

Iron Lock Imports, is pleased to present The Austrian Collection, featuring decorative wrought iron door trim manufactured by a family-owned iron forging company located in the Tyrolean Alps of Austria.

Iron forging pre-dates the history of ancient Rome where it became central to the manufacture of building materials and weaponry. Because Austria and its surrounding areas have high concentrations of iron ore, the craft of metal forging developed early on in the region. High quality malleable iron was first produced commercially by Moorish iron forgers in the Catalan region of Spain. The Moors were able to maintain a high level of iron production as a result of an improved smelting oven which came to be known as the Catalan Forge. This new technology eventually made its way into Austria where the furnace shaft of the Catalan oven was raised from its original height of four feet up to about ten feet in height to further increase production. This altered furnace became known as the *stückofen*, or *wolf* furnace because the enlarged metallic mass extracted from it was called a *stücke* or *wolf*.

Along with the Catalan Forge, the highly decorative Moorish style of forging, still popular in Spain and southern Europe, had a profound influence on Austrian iron forging. An excellent example of that Moorish influence is seen in the elegant lines and delicate shape of our signature piece, the Vienna mortise entry. Even now, demand for The Austrian Collection hardware in the U.S. is greatest in the sun-belt region where the cultural influence of old Spain and southern France predominates. Conversely, however, being a product of the Northern Alps, the Austrian Collection is also suitable for use in alpine settings such as ski lodges, condos and homes near winter recreation areas.

As beautiful as the trim may be, a door lock is only as good as its internal mechanism. A high quality door lock requires meticulous correlation among many small, interconnected parts. In this respect, lock-making requires skills similar to those used in the production of time pieces. The manufacture of both locks and watches developed more or less side-by-side in Germany and Switzerland. It is, therefore, not surprising that many old world craftsmen were often engaged in both trades. Just as Switzerland is considered the center for watch making, Germany is home to many of the worlds, finest lock manufacturers. Indeed, it was in Germany while searching for a supplier of high quality lock mechanisms, that we were introduced to, KFV, Karl Fleither & Co. The company, now a multi-national corporation, began as a small family business and has retained a time honored adherence to the highest standards of quality. In keeping with that tradition, we have incorporated KFV mortise locks and profile cylinders into the line.

While several Austrian Collection lock models are available with a U.S. style tubular latch and dead bolt, the line is intended to be used primarily with European mortise locks. Mortise locks, mainly used as entry locks, are also an excellent choice for interior passage and privacy doors. In fact, most European buildings are furnished exclusively with mortise locks throughout. Each of our mortise locks is equipped with a stainless steel face plate to ensure against corrosion. The powerful lever return spring, manufactured from high tensile stainless steel, assures a positive lever return and prevents a heavy iron lever from sagging even after years of continuous use.

Even though wrought or forged iron, unlike cast iron, is naturally resistant to rust and corrosion, our lock trim is heat treated with a black and silver galvanizing process further enhancing its resistance to radical changes in temperature and excessive moisture. Even in the severest climates, Austrian Collection finish is impervious to corrosion.

Although the designs shown in the catalog represent what we believe to be the optimum lever / rosette combinations, the Austrian Collection styles are easily adapted to suit personal tastes. Any lever in the collection may be combined with any escutcheon or rosette allowing the customer to “mix and match”.

Given the popularity of patio doors featuring multi-point mechanisms, we offer a complete multi-point lock package as well as “trim-only” options. Presently our trim is available only for multi-point locks using a European profile cylinder with 92 MM centers.

Certain areas of the U.S. now require the use of an emergency egress function - a lock mechanism that retracts both the latch and deadbolt when the interior lever is depressed. For an additional charge, any of our mortise lock styles can be furnished with the emergency egress feature.

With this brief introduction, we take great pride in offering the finest forged iron door hardware available anywhere:
